Project Context

- Project continues the DSD platform at dissertacoes.av.it.pt.
- Platform already supports dissertation proposals, interest, agreements and document upload.
- New focus this year: improving support for defense phase and final publication.
- Our team is responsible for the module “Juries & Defenses (S1 - no e-signature)”.

STATE-OF-ART (SYSTEM & GAPS)

- Current platform was modernized in previous PI project (React + FastAPI, NGINX, MongoDB/MariaDB).
- There is already support for document templates and calendar of defenses, but the flow is incomplete.
- Juries are only partially handled: president selection exists, but full jury composition, magic-link access and final package are missing.
- Bureaucracy around homologation, scheduling and final documents still relies on email/Excel and manual work from the secretary.

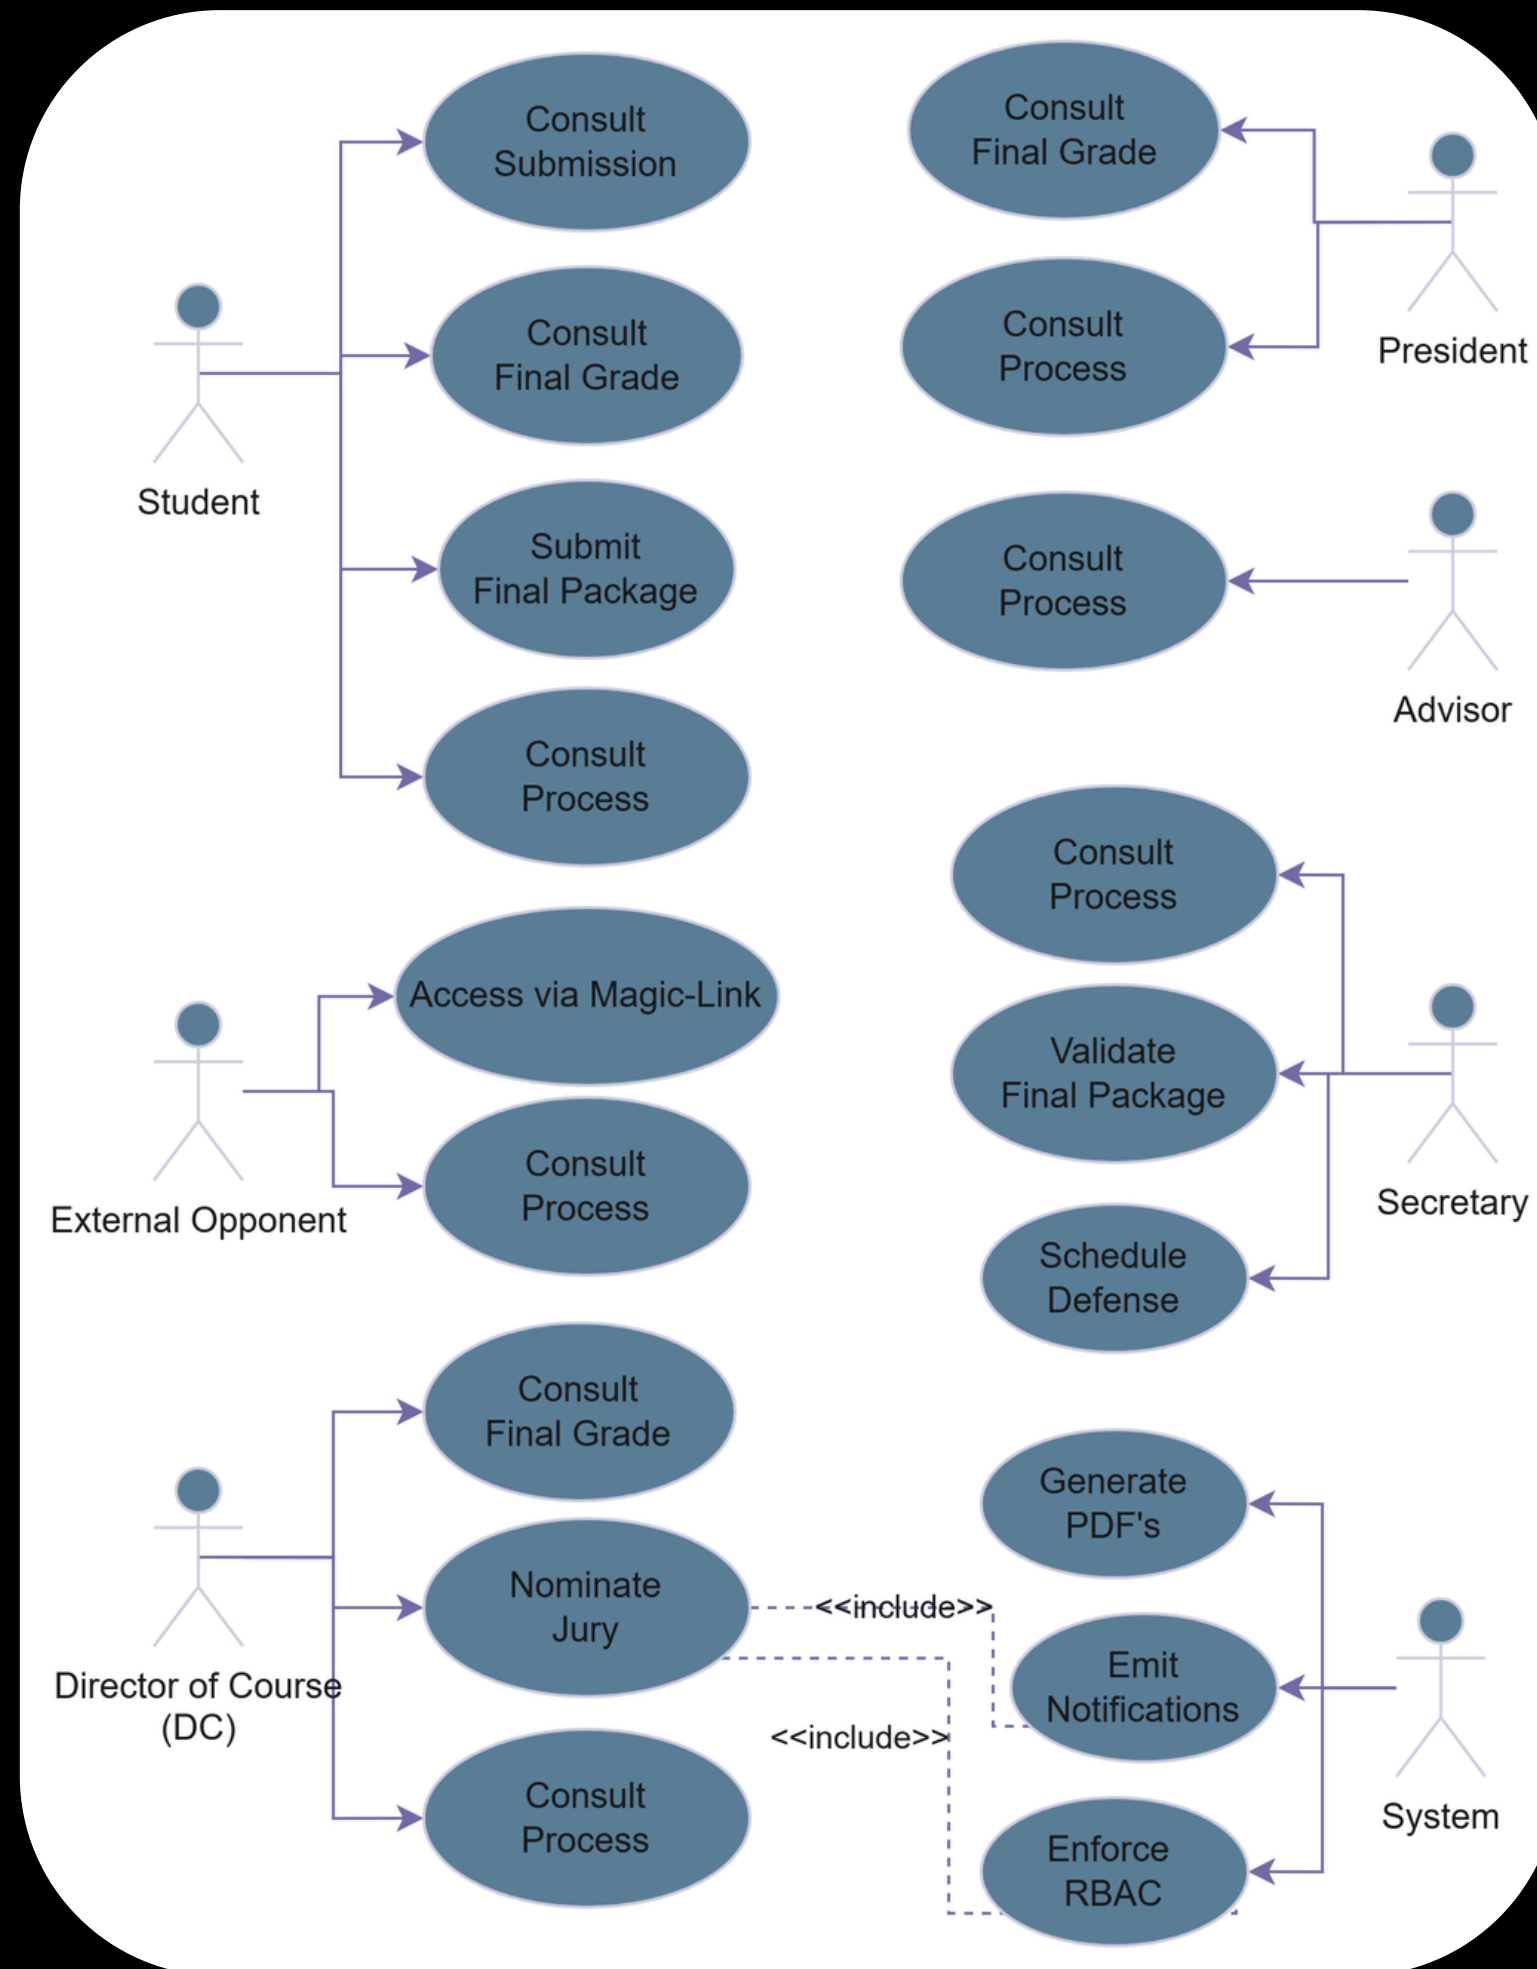

REQUIREMENTS GATHERING

- Documents & procedures from DETI about dissertation defenses (steps 1–8, resubmission, final docs).
- Meetings with supervisor to clarify scope and what is already implemented.
- Previous project: technical report, API docs and demo video.
- Goal of S1: model the real process of Juries & Defenses, without redesigning the whole system.

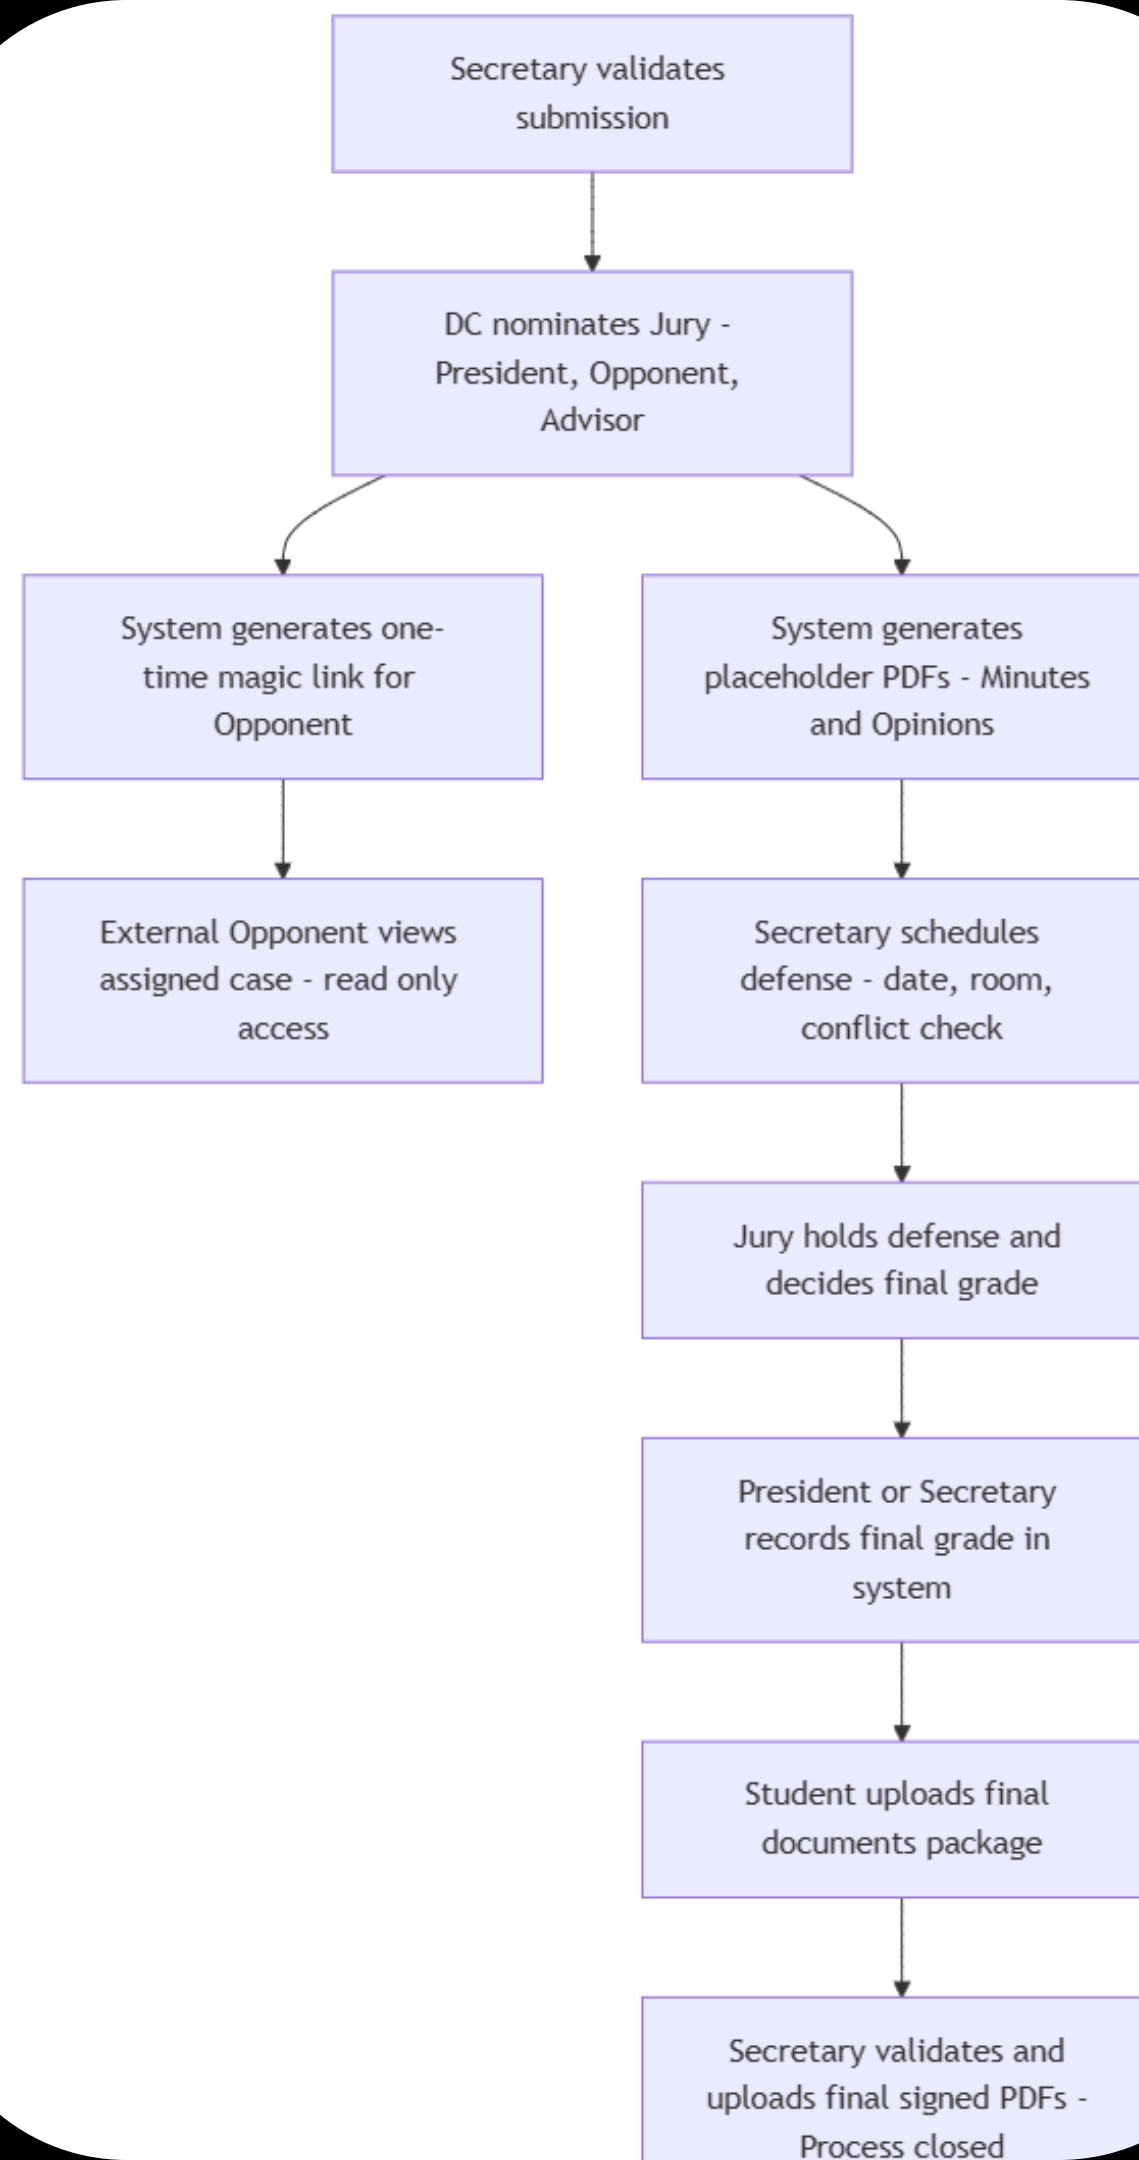

STAKEHOLDERS, ACTORS & PERSONAS

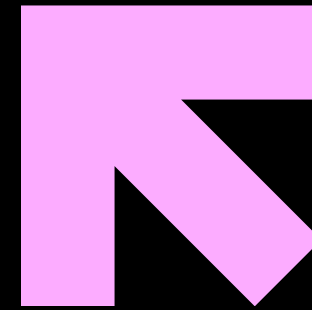

- Secretary (Gertrudes): manages jury states, schedules defenses, validates final package.
- Course Director (Frederico): nominates jury (President, Opponent, Advisor) and monitors grades.
- Student (Ana): sees date/room, knows remaining tasks, uploads resubmission and final package.
- External Opponent (Miguel): external user, accesses only his case via magic-link.
- President (Silva) & Advisor: mainly consult the process, ensure the agreed grade is correctly registered.

USE CASES

WORKFLOW

FUNCTIONAL REQUIREMENTS

- FR1 – Jury Nomination (DC)
- FR2 – Magic-link for External Opponent
- FR3 – Defense Scheduling (Secretary)
- FR4 – Placeholder PDF's (Minutes & Opinions)
- FR5 – Grade Recording & Publication
- FR12/13 – Resubmission + Final Package

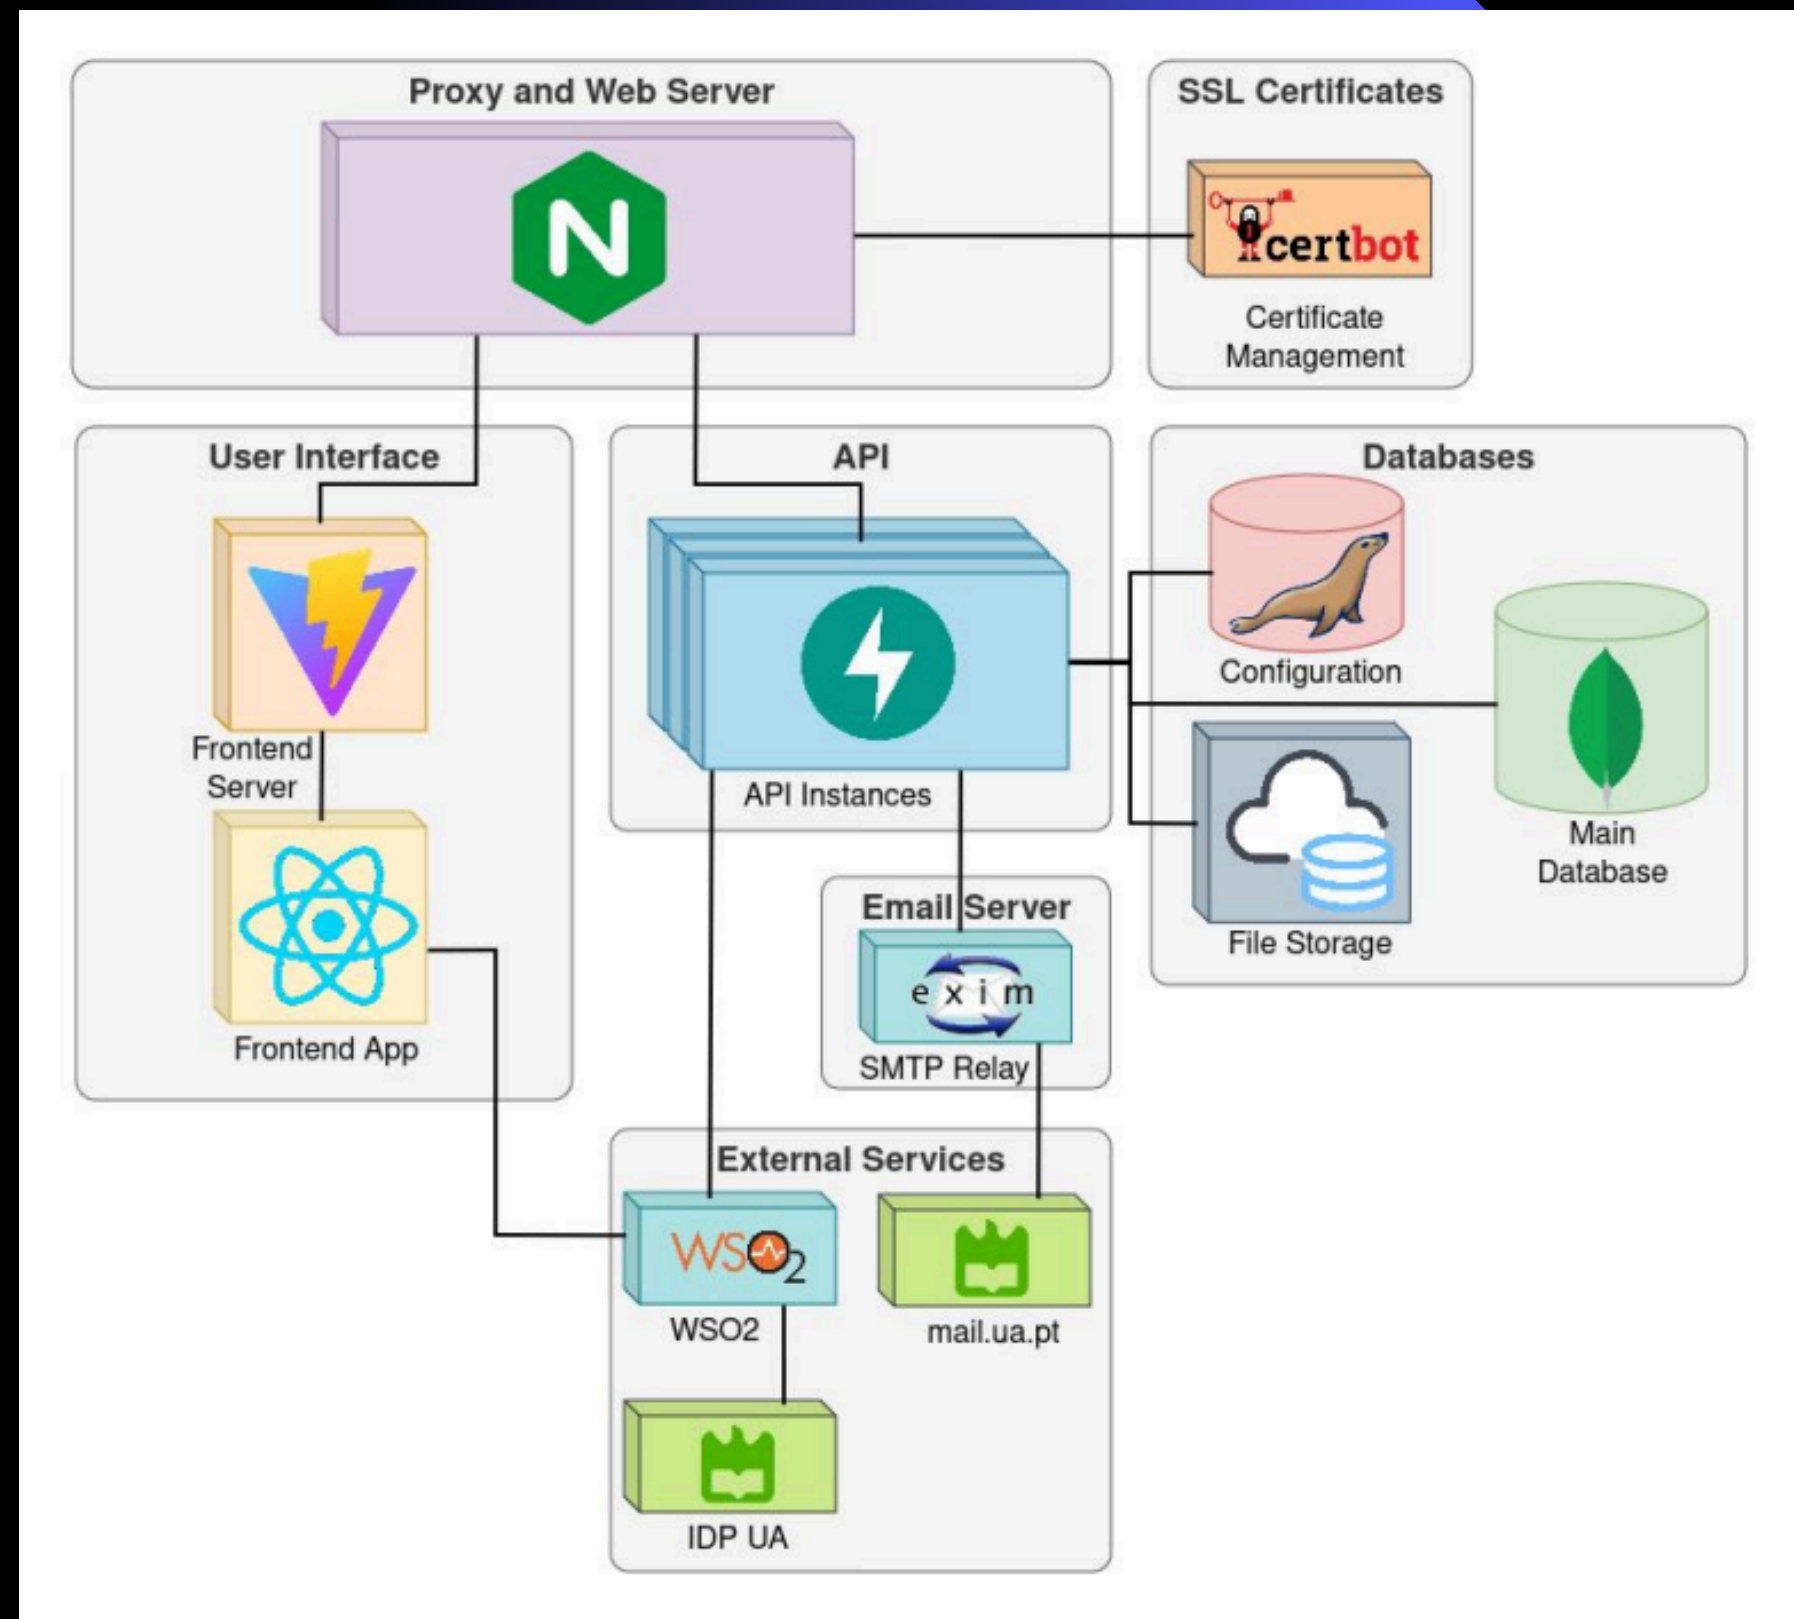

NON-FUNCTIONAL REQUIREMENTS

- Performance
- Security & RBAC
- Data integrity & Files
- Auditability
- Usability

SYSTEM ARCHITECTURE

- We reuse last year's architecture: NGINX proxy, React frontend, FastAPI API, MongoDB + MariaDB, SMTP and IdP.
- Our feature adds new APIs and pages but does not change the global architecture.
